

11.10 Section Exercises

1. Without the keyword `public`, all members of a class are private. Is it true or false?

2. Add the method members *NotEqual* and *GreaterLessThan* to the `TimeType` class.

11.11 Class Constructors

The class constructors are used to initialize the class objects when they are declared.

Syntax:

```
public class_name () {...} // default constructor
```

```
public class_name ( type para, ... ) {...} // general constructor
```

Note Constructors of a class are optional. In a class, there may be more than one constructor defined.

Here is an example of the `TimeType` class that includes constructors.

```
public class TimeType
{
    private int hrs;
    private int mins;
```
